SPEAKING SCRIPT

Introduction and documentation

Nuamah Asamoaa Hafsa

Documentation and backend support

Duration	about 2 minutes
Slot in the video	Opens the video (0:00)
On camera	Face to camera, then cut to README / docs folder

How to use this script

Read the spoken words naturally. Do not read lines in [SQUARE BRACKETS]; those are camera or screen cues. If you run long, skip a paragraph marked OPTIONAL. Aim for the duration on the cover. The full team video should land between 8 and 15 minutes.

Opening (on camera)

[FACE TO CAMERA. Team can stand behind you, or cut to a wide shot of everyone.]

Hello. We are Team Regimens from the Department of Computer Engineering at KNUST. This is our COE 454 Software Engineering project: an inventory and sales system for Outstretched Arm Enterprise, a small stationery shop that was still tracking stock and sales by hand in a notebook.

The notebook caused three problems: they could not see low stock in time, they could not trust the profit numbers when prices changed, and they could not work when the internet dropped. Regimens is our answer: a simple web app that works in the shop, even offline, and still calculates profit honestly.

The team (keep this brisk)

[SHOW: README team table, or name cards.]

Quickly, who did what. I am Hafsa. I own documentation and I support the backend. Albert leads the backend. Francis and Raymond own the database. David leads UI and UX. Peter and Benjamin own the frontend. You will hear each of them in a moment.

Documentation - how we actually worked

[SCREEN SHARE: docs folder. Click through file names, do not read every title slowly.]

Before we wrote a lot of code, we agreed how we would work. Our collaboration guide set the branching rule: main stays working, one branch per task, and a teammate reviews before we merge. That stopped us from overwriting each other.

Then we wrote the contracts. The ERD is the database picture. The API schema is the contract between frontend and backend. The UI and UX guide is what the shop owner should see. Architecture decision records explain why we chose React, Express, Postgres, and JWT, and why we went offline-first with a sync queue instead of hoping the network is always up.

As we built, we kept living docs in the repo: a demo walkthrough, a deploy guide for Vercel and Render, and a security checklist because this app handles money-related data. If a new teammate joins tomorrow, they start at the README, then the doc that matches their folder.

Handoff

That is the story and the paper trail. David will show how we designed the experience for a busy shop counter.
