SPEAKING SCRIPT

# UI and UX

David Kwame Castel

UI/UX and frontend

| | |
|---|---|
| **Duration** | about 1 minute 45 seconds |
| **Slot in the video** | Second (after Hafsa) |
| **On camera** | Face, then walk through live UI or Figma / screens |

### How to use this script

Read the spoken words naturally. Do not read lines in [SQUARE BRACKETS]; those are camera or screen cues. If you run long, skip a paragraph marked OPTIONAL. Aim for the duration on the cover. The full team video should land between 8 and 15 minutes.

## Who we designed for

*[FACE, then cut to login screen.]*

I am David. I led UI and UX. We did not design for a developer. We designed for a shop owner and a shop assistant who may be serving a customer while they tap. So the first test was: can they log in, sell an item, and see stock, in under a minute?

The primary user is the owner: they care about stock, sales, and profit. Staff need a short path to record a sale and nothing extra in the way. That is why the app is one shell, one search, one set of nav items, not five different layouts.

## What you see on screen

*[WALK THE LIVE APP. Hover the sidebar. Do not click every page - Peter and Benjamin will.]*

Login is calm and branded. After login, App Shell keeps breadcrumb, search, and notifications in the same place on every screen. Low stock is not buried: a banner and counts so they act before the shelf is empty. Money is in Ghana cedis, because that is how the shop thinks.

Colour does work, not decoration. Green is in stock. Orange is low. Red is out. Charts on profit use the same language as the inventory table. We kept forms short: name, category, stock, sell price, cost. If a field is not needed at the counter, it is not on the first screen.

## UX decisions that mattered

- Sale is a three-step story: add items, review, success. We did not dump everything on one long form.
- Protected routes: if you are not logged in, you never see stock or profit.
- Offline is visible. A sync status tells you the sale is queued, not lost. Trust is a UX feature.
- Settings let the owner change password after the demo login. We designed for real use after the class demo.

## Handoff

The screens are the contract with the user. Peter will show how we built the shell, inventory, and categories in React.
