SPEAKING SCRIPT

Frontend - shell, inventory, and categories

Peter Appiah

Frontend developer

Duration	about 1 minute 45 seconds
Slot in the video	Third (after David)
On camera	Screen share of the running app and a little code if you want

How to use this script

Read the spoken words naturally. Do not read lines in [SQUARE BRACKETS]; those are camera or screen cues. If you run long, skip a paragraph marked OPTIONAL. Aim for the duration on the cover. The full team video should land between 8 and 15 minutes.

What I built

[SCREEN: browser at localhost or Vercel. Optionally split with VS Code on App.jsx.]

I am Peter. I work on the frontend. The app is React with Vite. We chose that because it is fast to run locally and easy to deploy on Vercel. React Router is the map of the product: login, dashboard, products, categories, sales, reports, profit, backup, and settings.

Auth lives in context. After login we store a JWT and every request goes through one API client. Protected Route is the gate: no token, no inventory. That matches how the shop should work. You should not see another person's stock.

Inventory and categories - demo this

[CLICK: Dashboard, then Inventory, open edit on one product, then Categories.]

Dashboard is the morning view: how the shop is doing at a glance. Inventory is where the work happens. You can search, filter by in stock, low, or out, and export CSV if they still want a spreadsheet. Add or edit a product: name, SKU, category, stock, sell price, cost, and minimum stock. Those numbers come from the API, not from a notebook in the browser.

If this product has more than one cost layer, you will see them here: oldest stock listed first. That is the UI for the database idea Francis and Raymond will explain. I just had to show it so the owner is not surprised.

Categories are first-class. Notebooks, pens, paper - they can add their own groups. The category screen talks to its own API, and the product form uses the same list, so we do not get two different spellings of 'Pens'.

Handoff

That is the shell and the catalogue. Benjamin will take the sale, the reports, and what happens when the internet dies.
