SPEAKING SCRIPT

Frontend - sales, profit, and offline

Benjamin Azumah

UI/UX and frontend

Duration	about 1 minute 45 seconds
Slot in the video	Fourth (after Peter)
On camera	Screen share of sale flow, profit page, sync indicator

How to use this script

Read the spoken words naturally. Do not read lines in [SQUARE BRACKETS]; those are camera or screen cues. If you run long, skip a paragraph marked OPTIONAL. Aim for the duration on the cover. The full team video should land between 8 and 15 minutes.

The sale, as the shop does it

[CLICK through New sale, Confirm, Success. Speak while you click.]

I am Benjamin. I also work on frontend and UI. The path that pays the rent is New Sale. You pick products, quantities, then Review, then Confirm. We split it on purpose so they can catch a wrong quantity before stock moves. Success stays inside the same shell so it does not feel like they left the app.

Orders is the history of those sales. Reports is revenue over time. Profit is the page we are proud of: daily, weekly, monthly, yearly, with revenue, cost of goods, and gross profit. The chart is Recharts. The numbers come from the backend, not from multiplying today's cost by old sales.

Offline and keep-alive

[POINT at sync status if visible. OPTIONAL: turn on airplane mode, record a sale, turn network back on.]

Shops lose internet. We queue sales in IndexedDB with Dexie. If you are online we post to the API. If you are not, we save locally and flush when the browser comes back online. Last write wins if there is a conflict, and we do not silently delete a queued sale. That is UX plus engineering: the owner should see pending, not a blank error.

On Vercel the frontend pings the API every thirty seconds while the tab is open, because the free Render server sleeps. For a class demo that ping is the difference between a frozen login and a live system.

Settings and backup

Owner settings: change display name and password after the demo login. Backup is owner-only. I wired the screens; Albert locked the routes. That split is how we stayed fast without leaving holes.

Handoff

The UI is only as true as the API. Albert will show the backend that stamps prices, checks stock, and keeps the shop secure.
