SPEAKING SCRIPT

Database - schema and migrations

Ntim Francis Gyan

Database management and maintenance

Duration	about 1 minute 45 seconds
Slot in the video	Sixth (after Albert)
On camera	Screen share of migrations folder and ERD if you have it

How to use this script

Read the spoken words naturally. Do not read lines in [SQUARE BRACKETS]; those are camera or screen cues. If you run long, skip a paragraph marked OPTIONAL. Aim for the duration on the cover. The full team video should land between 8 and 15 minutes.

Why Postgres, why migrations

[SHOW: database/migrations folder, files 001 to 006.]

I am Francis. Raymond and I own the database. We use PostgreSQL because this is real shop data: users, products, sales, money. We did not dump a single SQL file and pray. We numbered migrations. Run migrate, and it only applies what is new. That is how seven people can pull main without breaking each other's tables.

The core model

[SHOW: ERD document or a simple table list on a slide.]

Users: owner and staff, with hashed passwords and roles. Products: name, SKU, quantity, unit price, minimum stock. Sales: who sold, total, sync status, time. Sale items: which product, how many, the unit price at that moment, the subtotal. Categories for grouping. Backups so the owner can snapshot and restore. Every money column is numeric, not float, because pesewas matter.

Foreign keys keep the story clean. You cannot have a sale line without a product. Delete a product and its layers go with it. Indexes on names and dates because reports filter by time and the shop searches by product name.

How we run it

Locally: create database regimens, copy env, npm run migrate, npm run seed. On Render the same DATABASE_URL is injected into the API. We never commit .env. The seed gives the demo owner and five stationery products so the frontend is never empty.

Handoff

That is the skeleton. Raymond will show cost, selling price history as layers, and why profit of old stock stays true.
